# DETERMINATION OF MOISTURE IN SOILS BY MEANS OF CALCIUM CARBIDE GAS PRESSURE MOISTURE TESTER

#### **FOP FOR AASHTO T 217**

Phase diagram

**Speedy Moisture Tester** 

### **Significance**

Moisture content of soils is a significant parameter in compaction. Soil is best compacted at or near what is called optimum moisture content. Soils that are too dry will need to have water added. Soils that are too wet will need to be dried prior to compacting. For these reasons, moisture content must be determined in the field in a timely manner.

This test procedure is particularly useful in the field in that the apparatus used is portable and no utilities are required. The "Speedy Moisture Tester," as the equipment is known, quickly determines moisture content as part of a chemical reaction between water and calcium carbide.

#### Scope

This procedure uses a calcium carbide gas pressure moisture tester to determine the moisture content of soils in accordance with AASHTO T 217. This FOP does not apply to the Super 200 D tester (see AASHTO 217).

<u>CAUTION</u>: This procedure involves a potentially dangerous chemical reaction. When calcium carbide reacts with water, acetylene gas is produced. Breathing the acetylene gas and running the test where potential for sparks or other ignition might cause a fire must be avoided.

#### Apparatus

06

- Calcium carbide gas pressure moisture tester
- Balance or scale, conforming to the requirements for AASHTO M 231 and having a capacity of 2 kg and sensitive to 0.1 g. Most testers include a balance built into the transportation container.

T217\_stu E&B/ID 4-1 October 2004

- Cleaning brush and cloth.
- Scoop (or cap built into unit) for putting the soil sample into the pressure chamber. Some testers include a cap built into the unit.
- Steel balls, 31.75 mm (1.25")

#### **Material**

Calcium carbide reagent meeting the requirements of AASHTO T 217.

Note 1: Check the manufacturer's recommendations for maximum storage life and replacement, and storage requirements. A change in color is an indicator of age.

#### **Procedure**

- 1. With the moisture tester in a horizontal position place three scoops, approximately 24 g, of calcium carbide, into the body.
- 2. Place two steel balls into the body of the tester with the calcium carbide.
- 3. Obtain a sample of soil of the wet mass specified by the manufacturer, using the balance built into the unit, and place the soil into the cap of the tester.

Note 2: This method shall not be used on granular material having particles large enough to affect the accuracy of the test. In general, no +4.75 mm (No. 4) material.

*Note 3:* If the anticipated moisture content exceeds the capacity of the instrument being used, then one-half of the specified soil mass should be placed into the unit, and the resulting gauge reading multiplied by two.

- 4. With the instrument in a horizontal position, so that calcium carbide does not come into contact with the soil, seat the cap on the body and tighten down on the clamp, thereby sealing the tester.
- 5. Turn the unit to vertical and allow the soil to fall from the cap into the pressure vessel. Shake the instrument horizontally with a rotating motion in order to avoid damaging the instrument. Do not allow the steel balls to hit the cap or the bottom of the pressure vessel. Shake the instrument vigorously for 60 seconds

then rest for 30 seconds. Continue shaking and resting cycles for up to 180 seconds in shaking cycles or until no further reaction occurs.

- 6. Allow time for the dissipation of the heat generated by the chemical reaction.
- 7. When the gauge needle stops moving, take a reading while holding the unit in a horizontal position at eye level.
- 8. Record the sample mass and the gauge reading.
- 9. Position the unit so that the cap is away from the user and slowly loosen the clamp to release the gas from the pressure chamber. Inspect the sample inside the pressure chamber. If it is not completely pulverized, a new sample must be obtained and tested after the instrument has been thoroughly cleaned.

1. The tester determines moisture content based on the wet mass of the soil. Moisture content based on the dry mass of soil is obtained from a conversion chart or curve supplied with each tester. See Figure 1 for curve from AASHTO T 217.

**Note 4:** Check the accuracy of the gauge and the conversion chart or curve periodically, in accordance with agency requirements, by testing samples of known moisture content. Develop correction factors, if necessary.

Reading gauge

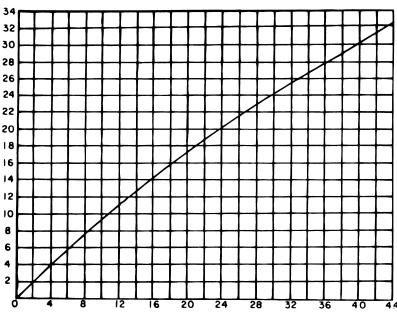

24

# **Example:**

Gauge reading: 18.5 Conversion from chart: 22.6 Recorded % moisture: 23%

**Figure 1. Conversion Curve for Moisture Tester** 

Moisture Content, Oven Dry, mass percent

25 Report

Results shall be reported on standard forms approved by the agency. Report moisture content to the nearest 1 percent.

26

## Tips!

- Follow the safety precautions suggested by the tester's manufacturer and by the maker of the calcium carbide reagent.
- Do not allow the steel balls to hit the cap or bottom of the pressure vessel.
- Remember to use the conversion chart or curves to determine moisture content based on <u>dry</u> mass of soil.

T217\_stu E&B/ID 4-5 October 2004

# **REVIEW QUESTIONS**

1.	For how long can calcium carbide be used? Indefinitely?
2.	What safety precautions need to be taken in performing the test procedure?
3.	How is moisture content related to the gauge reading?
4.	For how long should the tester be shaken?
5.	After shaking, but before reading the gauge, what should be done?
6.	What is the reported moisture content when your gauge reading is 14.6?

# PERFORMANCE EXAM CHECKLIST

# DETERMINATION OF MOISTURE IN SOILS BY MEANS OF CALCIUM CARBIDE GAS PRESSURE MOISTURE TESTER FOP FOR AASHTO T 217

Pa	articipant Name Exam Date		
Re	ecord the symbols "P" for passing or "F" for failing on each step of the checklist.		
Pr	Procedure Element Tr	ial 1	Trial 2
1.	. Shelf life of calcium carbide reagent checked?		
2.	. Correct amount of reagent placed in body of tester?		
3.	. The correct number and size of steel balls introduced into the vessel?		
4.	. Correct mass of moist soil placed in cap of tester?		
5.	. Cap clamped to body with tester in horizontal position?		
6.	. Soil allowed to fall from cap?		
7.	. Shaking done for properly (shake 60 seconds, rest for 30 seconds, for up to 180 seconds shaking)?		
8.	. Shaking done without steel balls hitting cap or bottom of tester?		
9.	. Tester vessel allowed to cool?		
10.	0. Gauge on vessel stops moving.		
11.	Reading taken with tester in horizontal position at eye level?		
12.	2. Sample mass and gauge reading recorded?		
13.	3. Tester positioned with cap away from user before gases slowly released?		
14.	4. Contents inspected for complete pulverization?		
15.	5. Gauge reading on wet mass basis converted to dry mass percent to nearest 1%? _
